

# Crop Enterprise Budget

## Sugar Beets, Thick-Planted, Wheatland Area

John P. Hewlett, Farm/Ranch Management Extension Specialist  
Chris Bastian, Research Associate

MP-72.3

University of Wyoming - August, 1994

This enterprise budget estimates typical costs and returns for sugar beets in the Wheatland area of Wyoming. It should be used only as a guide. The data presented are not taken from an actual farm. The major assumptions in this budget are presented below.

### LAND

The budget is based on a 500-acre farm, with 100 acres of sugar beets grown each year. Other enterprises included on this farm are: alfalfa establishment, 17 acres; alfalfa hay, 100 acres; dry beans, 75 acres; corn for grain, 62.5 acres; corn for silage, 62.5 acres; and setaside program, 23 acres. The remaining 60 acres; include roadways, fence lines, and farmsteads. Owned land is valued at \$750 per acre for flood-irrigated land and \$850 per acre for center pivot-irrigated land. Leased land is rented on a crop-share basis. For sugar beets, a 20 percent share of gross revenue is paid to the landowner. In turn, the landowner pays for all purchased irrigation water and 20 percent of the fertilizer, herbicide, and insecticide applied to the crop.

### LABOR

Labor is provided by the operator and one full-time employee. All labor, including operator labor, is valued at \$5 per hour plus 7.65 percent to cover social security and federal withholding taxes. Labor charges for the owner/operator represent an opportunity cost for the time spent in this enterprise. Some part-time labor is used on the farm for labor-intensive operations such as harvest.

### CAPITAL

The operator provides 50 percent of the long-term capital and 50 percent of the operating capital for this enterprise. Fifty percent of the long-term capital is borrowed at an interest rate of 9.75 percent APR (Annual Percentage Rate). Fifty percent of the operating capital is borrowed at an interest rate of 9 percent APR. The interest rates used here are for short-term planning. Real interest rates should be used for accurate long-term planning.

### MACHINERY, EQUIPMENT, AND BUILDINGS

A complete list of machinery, equipment, and buildings used in this enterprise and the associated values are provided in Table 1. All resources are assumed to be half depreciated. Estimated operating and ownership costs are given in Table 3. Table 3 lists only the resources used in this enterprise. Other resources used on the farm are not included. However, the reader should note that the resources listed in Tables 1 and 3 may also be used in other enterprises on the farm.

Each irrigated acre on the farm is assumed to be irrigated by a fraction of the total irrigation system. The irrigation water provided by each irrigation system is broken down as follows: 30 percent center pivot, 25 percent concrete ditch and tubes, and 45 percent gated pipe (plastic and aluminum, 50 percent each). This method was employed because crops will normally be rotated onto all farmed land over time. Table 2 estimates the cost per acre-inch for providing irrigation water with each irrigation system.

## OPERATIONS

Operations related to sugar beet production are listed in chronological order in the enterprise budget. The ground is prepared in early March, including fertilization. The beets are usually planted early in the following month. Irrigation is started in early July, with a total of seven irrigations per growing season. A total of 31 acre-inches of water is delivered per acre of sugar beets.

One hundred percent of the beet crop is insured against weather damage/loss. Because the crop is assumed to be thick-planted, it is thinned and weeded once by migrant laborers. Beet harvest begins in late September with defoliation. The beets are then pulled and hauled using equipment owned by the farm. The budgeted yield is 20 tons per acre at 19 percent sugar.

## ENTERPRISE BUDGET

Economic costs and returns for corn for grain production are summarized by operation in the enterprise budget. Costs are broken down by stage of production. General overhead and operator management have been calculated at 5 percent and 10 percent of all cash costs, respectively.

Costs and returns for the crop share-lease arrangement are also summarized in the budget. Costs paid in whole or in part by the landowner are listed in the landowner column. The tenant column describes the tenant's share of the appropriate cost and return items. The far right column has been provided to calculate changes from this base budget for your operation.

## SUMMARY

Gross income for the sugar beet enterprise is estimated at \$1,000 per acre. Total variable costs are estimated at \$532.21 per acre, with total fixed costs at \$213.18 per acre. The total of all costs for sugar beets is estimated at \$745.39 per acre, leaving a net projected return of \$254.61 per acre. The net projected returns for the share-lease arrangement are \$50.48 per acre for the landowner and \$204.13 per acre for the tenant.
