

**WYOMING MACHINERY AND
OPERATION COSTS**

BY

PAUL A. BURGNER

JOHN P. HEWLETT

Authors are research associate and extension farm and ranch management specialist, Department of Agricultural Economics, University of Wyoming, respectively.

ACKNOWLEDGEMENTS

The authors would like to express their appreciation to the machinery dealers in Wyoming, Montana, and Nebraska who were willing to take the time to assist with this project. Without their valuable assistance this project would not have been possible.

INTRODUCTION

Machinery costs are a major portion of total farm production costs. Because of this, effective machinery management is essential to maintain profitability in production agriculture. This bulletin is designed to help producers estimate the costs of machinery ownership and operation, as well as assist in making machinery management decisions.

The process outlined in this report will allow farm operators to estimate machinery costs with the aid of an electronic calculator. It is also the basis used for the machinery cost tables presented. These tables are meant to provide producers with estimated machinery costs. In addition, a computer program for estimating these same costs is available from the University of Wyoming, Cooperative Extension Service.

Table 4 presents the factors used to calculate the cost estimates for each machine. The average survey price for all of the machinery items is also found in Table 4. Purchase prices in this report are average list prices for new equipment as quoted by participating farm machinery dealers in Wyoming, southern Montana, and western Nebraska. The machinery dealers were asked to quote prices on machines equipped in a standard configuration for consistency.

Individual machinery table headings contain information on the name of the machine and options included in the quoted price. The top of each table contains the parameters used in the cost calculations. Included here are the purchase price; maximum life values; repair and depreciation factors; interest rate; and the taxes, housing, and insurance rate. For powered implements, the numbers presented will include Power Take Off (PTO) horsepower rating, fuel type, fuel price, average load factor, and fuel consumption rate. These values are used to determine the fuel cost for the machine.

The bottom portion of each table is the annual and per hour costs of owning and operating the machine. These values should be used as estimates. Actual prices, hours of use, and type of use vary with individual owners and machines. They also vary by how machines are used in the operation.

Most farm operators will purchase equipment at prices well below list price. Some dealers offer cash incentives, as well as substantial discounts for farmers who purchase large quantities of equipment. The price for any piece of equipment is negotiated between the dealer and purchaser at the time of sale. The procedures outlined below will allow operators to calculate costs for machinery purchased at a price other than the one listed. These annual machinery cost estimates should help the operator make more informed machinery investment decisions.

Costs are classified as either ownership or operating costs. Costs that do not vary with the amount of use are considered "fixed" or ownership costs. These costs include depreciation; opportunity interest; and taxes, housing, and insurance. Costs that vary with use are considered "variable" or operating costs. These costs would include fuel, lubrication, and repairs. Methods of estimation developed by the American Society of Agricultural Engineers and agricultural economists were used in estimating costs of owning and operating an individual machine.

The method of estimating fuel capacity and total operation costs is discussed in the final section of this text. The total cost of completing a farming operation can be estimated by combining operating costs (fuel, lubrication, and repairs) and ownership costs (depreciation; opportunity interest; and taxes, housing, and insurance) from one or more machinery components with the total cost of labor and purchased operating inputs. The methods of estimating machinery and operation costs are discussed in greater detail in the following sections.

DEPRECIATION

Over time, machinery values decrease due to use, age, and obsolescence. This loss in value is known as depreciation. In this report the straight line method is used to calculate annual depreciation. This method of depreciation distributes the annual depreciation cost equally over the life of a machine. Other methods of depreciation are available to more closely match the actual use of the machine.

It is assumed that each item will be used until it is worn out, or traded prior to the end of its useful life if the machine becomes obsolete before it wears out.

The estimated useful life of a machine in years is calculated using the following:

$$L = HUL / HAU$$

where,

- L = Useful life in years
- HUL = Estimated useful life in hours (from Table 4)
- HAU = Estimated hours of annual use

If an operator purchased a new two-wheel drive tractor for \$67,753 and plans to use it for 1,000 hours per year, the useful life would be calculated as follows:

$$L = 10,000 / 1,000$$

$$L = 10 \text{ years}$$

An operator would use the following formula with the information in Table 4 to determine the salvage value of a machine.

$$SV = [(LP * DF1) * (DF2)^L]$$

where,

- SV = Salvage value
- LP = List price of the machine
- DF1 = Depreciation factor 1 (from Table 4)
- DF2 = Depreciation factor 2 (from Table 4)
- L = Useful life in years (calculated above)

Taking the example tractor with list price of \$67,753 and an expected life of 20 years, the salvage value for this tractor is calculated below.

$$SV = [(\$67,753 * .68) * (.92)^{20}]$$

$$SV = [(\$67,753 * .68) * .4343885]$$

$$SV = [\$46,072 * .4343885]$$

$$SV = \$20,013.15$$

Annual depreciation cost is calculated using list price, salvage value, and years of useful life in the following formula:

$$DEP = [(LP - SV) / L]$$

where,

DEP = Annual depreciation expense
LP = List price of the machine
SV = Salvage value (calculated above)
L = Useful life in years (calculated above)

Using the same tractor example with list price of \$67,753, salvage value of \$20,013.15, and useful life of 10 years, the annual depreciation would be computed as follows:

DEP = $[(\$67,753 - \$20,013.15) / 10]$
DEP = $[\$47,739.85 / 10]$
DEP = \$4,773.98

OPPORTUNITY INTEREST

Owning machinery ties up capital that could be used in alternative investments. Because of this, an interest cost is calculated for the machinery investment. The interest cost should be high enough to cover earnings foregone by not investing in the next best alternative (e.g. savings). This alternative investment may be either an on-farm or off-farm business investment.

For the examples in this report, a survey of Wyoming financial institutions was completed to determine the nominal opportunity interest rate used to calculate opportunity interest cost. This rate was determined to be 5.95 percent of the average annual investment in machinery.

The first step in calculating opportunity interest cost is to determine the average machinery investment over the life of the machine. The following equation is used to calculate average machinery investment. (The average machinery investment is used for calculating taxes, housing, and insurance, as well as opportunity interest cost.)

$$AMI = [(LP + SV) / 2]$$

where,

AMI = Average machinery investment
LP = List price
SV = Salvage value (from depreciation calculations in the previous section)

Using the \$67,753 tractor in the previous examples, average machinery investment would be calculated as follows:

AMI = $[(\$67,753 + \$20,013.15) / 2]$
AMI = $\$87,766.15 / 2$
AMI = \$43,883.08

To calculate the interest cost for a piece of machinery, the average machinery investment is multiplied by the selected opportunity interest rate.

$$\text{OPPINT} = \text{AMI} * \text{OI}$$

where,

OPPINT = Annual opportunity interest on capital

AMI = Average machinery investment

OI = Opportunity interest rate

Using the average machinery investment calculated above, opportunity interest cost on the \$67,753 tractor would be:

$$\text{OPPINT} = \$43,883.08 * .0595$$

$$\text{OPPINT} = \$2,611.04$$

TAXES, HOUSING, AND INSURANCE (THI)

Taxes, housing, and insurance are referred to as THI in this report. The THI cost for each machinery item is computed using the appropriate THI rate from Table 1. Operators are required to pay property taxes on all farm machinery in Wyoming. Machinery exposed to weather will deteriorate and subsequently depreciate in value at a faster rate than covered equipment. Thus, a housing charge for all machinery is applied, even if the machine is not stored under a shelter. Machinery is insured against loss due to fire, theft, vandalism, etc. Premiums paid for insurance coverage are another cost of owning equipment.

The equation for estimating THI is:

$$\text{THI} = \text{AMI} * \text{THI Rate}$$

where,

THI = Annual charge for taxes, housing, and insurance

AMI = Average machinery investment (from opportunity interest calculation section)

THI Rate = THI rate for the machine, from Table 1

Computing the THI cost is illustrated below for the \$67,753 tractor from previous examples.

$$\text{THI} = \$43,883.08 * 0.0277$$

$$\text{THI} = \$1,215.56$$

Table 1. Taxes, Housing, and Insurance Percentages for Selected Machinery Groups.

Machinery Group	Taxes	Housing	Insurance	THI Rate
Tractors	0.82%	1.50%	0.45%	2.77%
Pickups and automobiles	0.87%	1.50%	4.20%	6.57%
Heavy duty trucks	0.87%	1.50%	4.20%	6.57%

Harvesters, self propelled	0.82%	1.50%	0.45%	2.77%
Implements	0.82%	1.50%	0.45%	2.77%

* The taxes, housing, and insurance percentages are added to arrive at the THI Rate.

REPAIRS

Repair costs are difficult to estimate due to differences in the operation and maintenance practices among individual operators. Working conditions for any machine will also have an impact on repair costs for a particular piece of equipment. Machinery companies are presently offering extended warranty packages for some more expensive machines, including tractors, trucks, and combines. These warranty plans are purchased when the machine is acquired and will cover, with a low deductible, most major repairs for two to five years. This substantially reduces the repair cost over the life of the contract.

Repair costs for any machine will vary with the hours of use. The following equation has been developed by the Society of Agricultural Engineers to help operators estimate the total repair expense over the life of a machine:

$$\text{REPAIRS} = \text{RF1} * \text{LP} * (\text{HUL} / 1000)^3$$

where,

- REPAIRS = Total accumulated repair costs
- LP = List price of machine
- RF1 = Repair factor 1 (from Table 4)
- RF2 = Repair factor 2 (from Table 4)
- HUL = Estimated useful life in hours (from Table 4)
- 1000 = A constant

Using the same \$67,753 tractor from previous examples, the purchaser would make the following calculation to determine total accumulated repair costs.

$$\begin{aligned} \text{REPAIRS} &= 0.01 * \$67,753 * (10,000 / 1,000)^3 \\ \text{REPAIRS} &= 0.01 * \$67,753 * (10)^3 \\ \text{REPAIRS} &= 0.01 * \$67,753 * 1000 \\ \text{REPAIRS} &= \$677.53 * 100 \\ \text{REPAIRS} &= \$67,753 \end{aligned}$$

The equation to calculate average annual repair cost from the total accumulated repair cost is:

$$\text{ANNUAL REPAIRS} = \text{REPAIRS} / \text{L}$$

where,

- ANNUAL REPAIRS = Average annual repair cost
- REPAIRS = Total accumulated repair costs
- L = Useful life in years (from depreciation calculations)

The machinery owner will be more interested in the average annual repair cost than the total accumulated repair cost. Using the tractor example, the following calculation can be made:

$$\begin{aligned} \text{ANNUAL REPAIRS} &= \$67,753 / 10 \\ \text{ANNUAL REPAIRS} &= \$6,775.30 \end{aligned}$$

FUEL AND LUBRICATION

Fuel and lubrication costs vary based on hours of machine use and load placed on the engine. The larger the load, the more fuel a tractor will consume. The load on the tractor is expressed as a percentage of maximum horsepower available. Equations for estimating fuel and lubrication costs are as follows:

TRACTORS AND SELF-PROPELLED EQUIPMENT

$$\text{FUEL} = \text{FE} * (\text{LOAD} * \text{PTO}) * \text{PFUEL} * \text{HAU} * 1.15$$

where,

FUEL = Annual fuel and oil cost

FE = Fuel efficiency (as illustrated below)

for diesel:

$$FE = 0.52 * load + 0.77 - (0.04 * \sqrt{738 * LOAD + 173})$$

for gasoline:

$$FE = 0.54 * LOAD + 0.62 - (0.04 * \sqrt{697 * load})$$

for propane:

$$FE = 0.53 * LOAD + 0.62 - (0.04 * \sqrt{646 * LOAD})$$

LOAD = Average percentage of total tractor horsepower demanded

PTO = PTO horsepower of the tractor

PFUEL = Price of fuel, including applicable taxes

HAU = Hours of annual use

1.15 = A constant used to estimate fuel and oil cost, with oil at 15 percent of fuel cost

The tractor used in our previous examples is a 150-horsepower diesel used at 60 percent load for 1,000 hours per year. Calculating fuel and oil cost is shown below, with fuel efficiency for the diesel calculated first:

$$FE = 0.52 * 0.60 + 0.77 - (0.04 * \sqrt{738 * 0.60 + 173})$$

$$FE = 0.52 * 0.60 + 0.77 - (0.04 * \sqrt{615.8})$$

$$FE = 0.52 * 0.60 + 0.77 - (0.04 * 24.815)$$

$$FE = 0.52 * 0.60 + 0.77 - 0.9926$$

$$FE = 0.312 + 0.77 - 0.9926$$

$$FE = 0.0894$$

and,

$$\text{FUEL} = 0.0894 * (0.60 * 150) * 0.802 * 1,000 * 1.15$$

$$\text{FUEL} = 0.0894 * 90 * 0.802 * 1,000 * 1.15$$

$$\text{FUEL} = 8.046 * 0.802 * 1,000 * 1.15$$

$$\text{FUEL} = 6.4529 * 1,000 * 1.15$$

$$\text{FUEL} = 6,452.90 * 1.15$$

$$\text{FUEL} = \$7,420.84$$

Fuel and oil cost per hour may be more useful to the machinery operator than annual fuel and oil cost. It is calculated by dividing the annual fuel and oil cost by the hours of annual use. If the tractor is used 1,000 hours per year fuel cost per hour is computed as follows:

$$\text{FUEL/HR} = \text{FUEL} / \text{HAU}$$

where,

FUEL/HR = Cost of fuel and oil per hour

FUEL = Annual cost for fuel and oil

HAU = Hours of annual use

$$\text{FUEL/HR} = \$7,420.84 / 1000$$

$$\text{FUEL/HR} = \$7.42$$

OTHER POWERED EQUIPMENT

Vehicles other than tractors and self-propelled equipment use the following equations to estimate annual fuel cost and fuel cost per mile. (These calculations require the operator to estimate the fuel consumption rate of the vehicle.)

$$\text{FUEL} = (\text{MAU} / \text{MPG}) * \text{PFUEL} * 1.15$$

where,

FUEL = Annual fuel and oil cost

MAU = Miles of annual use

MPG = Milestravelled per gallon of fuel used (defined)

PFUEL = Price of fuel, including applicable taxes
 1.15 = A constant used to estimate fuel and oil cost, with oil at 15%
 of fuel cost

An example of this fuel calculation is a 1/2 ton pickup that averages 15 miles per gallon of gasoline and 10,000 miles of use per year. The fuel cost per year and per mile can be calculated as follows:

FUEL = (10,000 / 15) * \$1.027 * 1.15
 FUEL = 666.667 * \$1.027 * 1.15
 FUEL = \$684.67 * 1.15
 FUEL = \$790.82

and,

FUEL/MI = \$790.82 / 10,000
 FUEL/MI = \$0.079

COST ADJUSTMENTS

Assumptions used in computing costs for each equipment item are reported at the top of each corresponding table. In cases where these assumptions differ from the individual operator's situation, these costs can be adjusted to fit the situation. The operator has two choices for adjusting costs to his specific operation. He may use the formulas and factors presented in the accompanying text or he may use the adjustment procedure outlined below.

To adjust ownership costs, an adjustment factor can be derived. This adjustment factor could be used to calculate new ownership costs based on the price paid for the machine. The following equation and example show how this is done:

$$ADJ = PRICE PAID / LIST PRICE$$

where,

ADJ = Adjustment factor
 PRICE PAID = Price paid by the operator
 LIST PRICE = Purchase price listed in Table 4 for an individual

equipment item

If the operator were able to purchase the \$67,453 example tractor for \$60,000, the adjustment factor and respective ownership costs would be as follows:

$$ADJ = \$60,000 / \$67,453$$

$$ADJ = 0.885$$

Using the adjustment factor of 0.885, each category of ownership cost for the example tractor is adjusted below:

$$DEP_{adj} = ADJ * DEP$$

$$\text{DEP}_{\text{adj}} = 0.885 * \$4,773.98$$

$$\text{DEP}_{\text{adj}} = \$4,224.97$$

$$\text{OPPINT}_{\text{adj}} = \text{ADJ} * \text{OPPINT}$$

$$\text{OPPINT}_{\text{adj}} = 0.885 * \$2,611.04$$

$$\text{OPPINT}_{\text{adj}} = \$2,310.77$$

$$\text{THI}_{\text{adj}} = \text{ADJ} * \text{THI}$$

$$\text{THI}_{\text{adj}} = 0.885 * \$1,215.16$$

$$\text{THI}_{\text{adj}} = \$1,075.42$$

Repair costs and fuel and lubrication costs would not be adjusted by the constant factor, because these costs vary by the amount and type of use, not purchase price. However, operating costs may need to be adjusted if the price of fuel and/or oil differ substantially from the tabled values. This can be accomplished by dividing the fuel cost by the fuel price at the top of the machinery table, and then multiplying the resulting number by the new fuel price.

OPERATION COSTS PER ACRE

It is necessary to calculate machinery costs per acre to determine the cost of a given operation. Costs of several operations may be combined to determine the total cost per acre for a given enterprise. The following section will demonstrate a method for (1) determining the field capacity (acres per hour) for machinery, (2) conversion to hours per acre, and (3) calculation of cost per acre for an operation.

FIELD CAPACITY

The field capacity for a given operation is estimated using a combination of speed, field efficiency, and implement width. Speed is determined by the type of operation, available horsepower, and personal preference of the operator. Field efficiency is determined by operator experience, the number of turns made, and the number of times the operation is interrupted for refueling, adding inputs, and checking the equipment. Width is determined by the size of the piece of machinery. Typical values for field efficiency and speed are presented in Table 5. The equation for calculating the field capacity for an operation is:

$$\text{FC} = \text{S} * \text{W} * \text{FE} / 8.25$$

where,

- FC = Field capacity in acres per hour
- S = Speed in miles per hour
- W = Width of the implement in feet
- FE = Field efficiency (%)
- 8.25 = a constant

The following example calculation is for a 15 foot grain drill being pulled at 4 miles per hour and having a field efficiency of 70 percent.

$$\text{FC} = 4 * 15 * .70 / 8.25$$

$$\text{FC} = 60 * .70 / 8.25$$

$$\text{FC} = 42 / 8.25$$

$$FC = 5.09 \text{ acres per hour}$$

HOURS PER ACRE

The conversion of acres per hour to hours per acre is made by taking the inverse of the value calculated for field capacity above. Hours per acre are calculated using the following equation:

$$HR/AC = 1 / FC$$

where,

HR/AC = Hours per acre

FC = Field capacity (calculated above)

Using the value for field capacity calculated in the previous example, the conversion to hours per acre is completed below.

$$HR/AC = 1 / 5.09$$

$$HR/AC = 0.196$$

TOTAL OPERATION COST PER ACRE

The determination of cost per acre for a given operation requires assumptions be made about the equipment used. The operator must determine the total number of hours that all machinery involved in the operation are used per year. Next, the speed and field efficiency must be determined (estimates for these values are in Table 5). Finally, the horsepower required must be estimated to calculate fuel use (estimated horsepower requirements are listed in Table 6). The use rate and cost per unit of any operating inputs (fertilizer, seed, chemical, twine, etc.) and the total hourly cost of operator labor must be included in the calculation to determine total cost per acre for the operation.

Using the 150 horsepower tractor and 15 foot grain drill defined in previous examples, the following example has been developed. Each step will be explained with the final result being a total cost per acre for planting malting barley.

The machinery is defined using following parameters:

(A) 150 horsepower tractor

- (1) \$67,753 purchase price
- (2) 1,000 hours annual use (in all farm enterprises, not just in the malting barley production)
- (3) 10,000 hours useful life

(B) 15 foot grain drill

- (1) \$9,431 purchase price
- (2) 160 hours annual use (in all farm enterprises, not just in the malting barley production)
- (3) 1,200 hours useful life
- (4) 30 horsepower required

It is important to include all hours of annual use for the machines involved in the operation to calculate accurate depreciation, opportunity interest, and THI values. The horsepower required is used to determine percent load factor (30 hp / 150 hp = 20% load) on the tractor used in the operation. This is important in determination of the fuel cost for the operation. Table 2 contains the assumptions required to determine the machinery costs per hour and the results of the calculations for the example tractor and grain drill listed above. These per hour costs are then used in Table 3 to calculate the cost per acre for the total operation.

Table 2. Calculated Annual Machinery Costs and Cost per Hour.

WHEEL TRACTOR - ISO PTO HP

Purchase Price	->	\$67,753	Year Quoted	->	1992
Hours to Wearout	->	10,000	Maximum Life	->	20 Years
Dep. Factor 1	->	0.68	Repair Factor 1	->	0.01
Dep. Factor 2	->	0.92	Repair Factor 2	->	2.00
PTO Horsepower	->	150	Percent Load Factor	->	60.00 %
Fuel Type	->	DIESEL	Fuel Price	->	\$0.802 Per Gal.
Fuel Consumption	->	8.04 Gal/Hr			
Percent of Average Investment Charged for Opportunity Interest				->	5.95%
Percent of Average Investment Charged for Tax, Housing & Insur.				->	2.77%

ESTIMATED ANNUAL COSTS AND COST PER HOUR

Parameters for the operation must be estimated to calculate the accomplishment rate and the final cost of the operation. The operation parameters for planting malting barley are as follows:

- (A) 15 feet width of operation
- (B) 4 miles per hour field speed
- (C) 70 percent field efficiency
- (E) \$5.50 per hour total operator labor rate (including FICA and benefits)
- (F) malting barley seed
 - (1) 0.95cwt per acre seeding rate
 - (2) \$14.50 perwt cost of malting barley seed

These parameters are used to calculate the cost per acre for planting malting barley presented in Table 3. This example outlines the calculations required to determine the cost per acre for planting malting barley with the 150 HP tractor and 15 foot grain drill defined above.

Table 3. Example for Determination of Cost Per Acre.

PLANT MALTING BARLEY			
MACHINERY COMPLIMENT AND OPERATION COSTS			
ACCOMPLISHMENT RATE:		5.09 Acres per Hour	
		0.196 Hours per Acre	
COST CATEGORY	INPUT AND RATE	COST/HOUR	COST/ACRE
Operating Inputs:			
Input #1: Barley Seed	0.95 cwt @ \$14.50	=====>	\$13.78
Repairs:			
Power Unit:	150 HP Tractor	\$6.78	\$1.33
Implement #1:	Grain Drill - 15 ft	\$6.22	\$1.22
Fuel and Oil:			
Power Unit:	150 Hp Tractor	\$4.37	\$0.86
Operator Labor:		\$5.50	\$1.08
TOTAL VARIABLE COSTS		\$22.87	\$18.27
Depreciation:			
Power Unit:	150 HP Tractor	\$4.77	\$0.93
Implement #1:	Grain Drill - 15 ft	\$5.97	\$1.17
Opportunity Interest:			
Power Unit:	150 HP Tractor	\$2.61	\$0.51
Implement #1:	Grain Drill - 15 ft	\$2.17	\$0.43
Tax, Housing & Insur:			
Power Unit:	150 HP Tractor	\$1.22	\$0.24
Implement #1:	Grain Drill - 15 ft	\$1.01	\$0.20
TOTAL FIXED COSTS		\$17.75	\$3.48
TOTAL OPERATION COSTS		\$40.62	\$21.75

COMPUTER SOFTWARE

Computer software for estimating these machinery and operation costs is available from the University of Wyoming, Cooperative Extension Service. This program allows individuals to enter their own values to determine actual cost for machinery and operation costs. Users may define various power unit and implement resources and combine them at will to determine operation costs. In addition, whole operations may also be saved. The methods of cost calculations outlined in this bulletin are used in the software program. This greatly simplifies the process of estimating both machinery and operation costs.

Table 5. Field Efficiency and Speed Parameters for Selected Implements.

Implement	Field Efficiency		Field Speed	
	Range (%)	Typical (%)	Range (mph)	Typical (mph)
Moldboard plow	70 - 90	80	3.0 - 6.0	4.5
Tandem disk	70 - 90	80	3.0 - 6.0	4.0
Field cultivator	70 - 90	85	3.0 - 8.0	5.5
Roller harrow	70 - 90	80	4.0 - 6.0	5.0
Roller-packer	70 - 90	80	4.5 - 7.5	6.0
Rotary hoe	70 - 85	80	5.0 - 10.0	7.0
Row crop cultivator	70 - 90	80	2.5 - 5.0	3.5
Row crop planter	50 - 75	60	3.0 - 7.0	4.5
Grain drill	65 - 85	70	2.5 - 6.0	4.0
Combine	65 - 80	70	2.0 - 5.0	3.0
Mower	75 - 85	80	4.0 - 7.0	5.0
Side delivery rake	70 - 85	80	4.0 - 5.0	4.5
Baler	60 - 85	75	2.5 - 5.0	3.5
Big bale baler	55 - 75	65	3.0 - 5.0	3.5
Forage harvester	50 - 75	65	1.5 - 5.0	2.5
Sugar beet harvester	60 - 80	70	2.5 - 5.0	3.0
Beet topper/defoliator	60 - 80	70	2.0 - 3.0	2.5
Bean cutter/windrower	70 - 90	80	2.0 - 5.0	3.5
Fertilizer spreader	60 - 70	70	3.0 - 5.0	4.5
Boom-type sprayer	50 - 80	65	3.0 - 7.0	6.5

Table 6. Machinery Power Requirements for Selected Implements.

Implement Name	Unit	PTO Horsepower Required per Unit
Moldboard plow	bottom	11 - 46
Field cultivator	foot	6 - 8
Land plane	foot	5 - 14
Spike tooth harrow	foot	1 - 2
Subsoiler	shank	9 - 20
Rotary hoe	foot	1 - 3
Row-crop cultivator	row	3 - 5
Row planter	row	2 - 7
Grain drill	foot	5 - 18
Side delivery rake	foot	3 - 5
Small square baler	unit	21 - 27
Forage harvester	row	52 - 63
Sugar beet harvester	row	17 - 23
Beet topper	row	8 - 11

TABLE 7. MACHINERY OPTION ABBREVIATIONS.

The following abbreviations are used to help identify the optional equipment included on the listed machinery.

ABBR.	DESCRIPTION	ABBR.	DESCRIPTION
<u>Option:</u> Transmission		<u>Option:</u> Hitches and Miscellaneous	
HYDRO	Hydrostatic Drive	CAT2	Category 2 Hitch
PWRSFT	Powershift Transmission	CAT3	Category 3 Hitch
AUTO	Automatic Transmission	REM2	Two Remote Hydraulics
4S	Four Speed Transmission	REM3	Three RemoteHyd.
5S	Five Speed Transmission	PTO	Power Take Off Driven
 <u>Option:</u> Running Gear		 <u>Option:</u> Cabs and Roll Guards	
PS	Power Steering	ROPS	Roll Over Protection System
PB	Power Brakes	CAB	Machinery Cab
DW	Dual Rear Wheels	AIR	Air Conditioner
RT	Radial Tires	STR	Stereo
2WD	Two Wheel Drive		
4WD	Four Wheel Drive		
MFD	Mechanical Front Wheel Drive
